```
This cDNA encodes a murine RANKL, a ligand for the RANK (receptor cc activator of necrosis factor-kappaB (NF-kB)) polypeptide. RANK is a cc member of the tumour necrosis factor (TMP) family. A soluble RANK cc may be used for inhibiting activation of NF-kB, by contacting a cell cc expressing membrane-associated RANK with a soluble RANK which binds to cc can be cc used to induce maturation of dendritic cells and enhance their cc used to induce maturation of dendritic cells and enhance their cc allo-stimulatory capacity, thereby augmenting an immune response. The cc immune or inflammatory response. Inhibition of NF-kB by RANK antagonists cc may be useful in ameliorating negative effects of an inflammatory capacity of the reactions, or acute inflammatory cresponse that result from triggering of RANK, e.g. in treating toxic shock or sepsis, graff-versus-host reactions, or acute inflammatory caponse that result from triggering of RANK, e.g. in treating toxic cc characterised by neoplastic cells that express RANK. RANKL polypeptides cc can also be used to identify inhibitors of RANK and thus inhibitors of can inflammatory response, and also for protecting RANK-expressing cells from the negative effects of chemotherapy or the presence of high levels of TNF-alpha. The products can also be used for detection and drug cc screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query

                                                                                                                             This cDNA encodes a murine RANKL, a ligand for the RANK (receptor call value) of necrosis factor-kappaB (NF-KB)) polypeptide. RANK is a collvator of necrosis factor-kappaB (NF-KB)) polypeptide. RANK is a commber of the tumour necrosis factor (TNF) family. Host cells transformed commended to the colls transformed controlled acid can be used to produce recombinant RANK protein. The soluble cank may be used for inhibiting activation of NF-KB, by contacting a cell expressing membrane-associated RANK with a soluble RANK which binds to composition may also be used for regulating an immune or inflammatory response. Inhibition of NF-KB by RANK antagonists may be useful in ameliorating negative effects of an inflammatory response that result from triggering of RANK, e.g. in treating toxic shock or sepsis, graft-versus-host reactions, or acute inflammatory reactions. They can also be used in adjunct therapy for disease characterised by neoplastic cells that express RANK. The products or an also be used for detection and drug screening.

CC kappaB (RANK) proteins and their corresponding DNAs. RANK is a member CC of the tumour necrosis factor (TNF) receptor superfamily and associates CC in the regulation of immune and inflammatory response. The receptors of immune and inflammatory responses. The receptors of immune and inflammatory responses. The receptors CC are useful for regulating immune response and in screening for inhibitors CC dasays for inhibitors of signal transduction, e.g. for screening the CC assays for inhibitors of signal transduction, e.g. for screening the CC are useful in ameliorating the negative effects of an inflammatory cresponse that result from triggering of RANK with TRAF1, TRAF2, TRAF3, CC RRAF5 and particularly TRAF6. NF kappaB inhibition by RANK antagonists creations and the effects of bone resorption. RANK acts as an anticce shock or sepsis, graft-versus-host reactions, acute inflammatory corresponse that result from triggering of RANK, e.g. in treating toxic shock or sepsis, graft-versus-host reactions, acute inflammatory corrections and the effects of bone resorption. RANK acts as an anticce apoptotic signal and rescue the cells that express RANK from apoptosis. Soluble forms of the receptor are used in vivo or in vitro based corrections to farmation of a signal via RANK. RANK compositions are used in the development of both agonists or antagonists of RANK activity, as an expression of disease characterised by neoplastic cells that corrections are used as inhibitors of diseases characterised by neoplastic cells that corrections and for modulating obsecolast function and activities. They are used as inhibitors of diseases associated with excess bone resorption and as immunosuppressants or anti-inflammatory agents. The RANK DNAs are used in the presence or distribution of recombinant proteins. The RANK DNAs are useful for the expression of recombinant proteins, while the proteins are useful or the resorption of soluble RANK, or monitor RANK interactions of corrections of soluble RANK, or monitor RANK light of the res
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-MAR-1997;

RANK is mapped to chromosome 18q22.1 and its ligand (RANKL) to chromosome 13q14. RANK and RANKL are type 1 and type 2 transmembrane proteins respectively. RANK is a member of the tumour necrosis factor (TNF) superfamily and it closely resembles CD40 in the extracellular region. RANK associates with TNF receptor-associated factor (TRAF) 2 and TRAF3. The DNA molecules are useful for producing ligands of RANK. The ligands are useful for regulating immune response and in screening for inhibitors of RANK. The present sequence is murine RANKL cDNA.
